

Is the Physiotherapist of the Future Advanced?

A short Symposium on Advanced Practice
Physiotherapy (APP) in Emergency Departments and
Orthopedic Clinics

Advanced practice physiotherapy care in
emergency departments for patients with
musculoskeletal disorders: Preliminary
results of a pragmatic randomized
controlled trial and cost analysis

François Desmeules, PhD, PT, OPPQ fellow
Head of Graduate APP Programs
Full Professor, School of Rehabilitation
University of Montréal

Researcher, Centre de recherche de l'Hôpital
Maisonneuve-Rosemont, Montreal, Québec,
Canada

Université 
de Montréal et du monde.

Background

Overcrowding in emergency departments (EDs) worldwide;

- Will worsen with aging populations, physician shortages.

Canada is among the countries with the longest ED waiting times.

Musculoskeletal disorders (MSKD) represent at least 25% of ED visits;

- MSKD affect 11 million Canadians per year.

Traditionally, ED physicians are the first-contact practitioners who manage patients with MSKD;

- Limited knowledge and confidence in MSKD care.

Background

New collaborative models of care including physiotherapists in advanced practice roles to help relieve physicians' burden

- Dx and triage
- Ordering medical imaging or prescribing or recommend medications.

Advanced practice physiotherapy (APP) can improve outcomes for patients with MSKD as well as improve resources use in health care systems.

APP models of care are emerging worldwide

- More evidence is needed
- Large high quality, pragmatic RCTs are needed

STUDY PROTOCOL

Open Access

Advanced practice physiotherapy care in emergency departments for patients with musculoskeletal disorders: a pragmatic cluster randomized controlled trial and cost analysis

E. Matifat¹, E. Berger Pelletier², R. Brison³, L. J. Hébert^{4,5}, J.-S. Roy^{4,5}, L. Woodhouse⁶, S. Berthelot⁷, R. Daoust⁷, M.-J. Sirois⁵, R. Booth⁸, R. Gagnon^{4,5}, J. Miller⁸, Y. Tousignant-Laflamme⁹, M. Emond⁷, K. Perreault^{4,5} and F. Desmeules^{1,10*}

Full article in preparation to be submitted

Objectives

To evaluate the impact of an APP-led model of care compared to usual physician ED care for patients with a minor MSKD.

Specific objectives:

1. Compare effectiveness of care in terms of patients-related outcomes;
2. Compare healthcare resource utilization;
3. Compare wait times and ED length of stay.
4. Compares direct costs and perform a cost-utility analysis

STUDY PROTOCOL

Advanced practice physiotherapy care in emergency departments for patients with musculoskeletal disorders: a pragmatic cluster randomized controlled trial and cost analysis

E. Matifat¹, E. Berger Pelletier², R. Brison³, L. J. Hébert^{4,5}, J.-S. Roy^{4,5}, L. Woodhouse⁶, S. Berthelot⁷, R. Daoust⁷, M.-J. Sirois⁵, R. Booth⁸, R. Gagnon^{4,5}, J. Miller⁸, Y. Tousignant-Laflamme⁹, M. Emond⁷, K. Perreault^{4,5} and F. Desmeules^{1,10*}

Methods

- Stepped wedge pragmatic multicenter trial
- 6 Canadian EDs
- 12 APP trained physiotherapists
- Participants were not blinded

Enrollment

Allocation

Follow-up

Methods

Inclusion criteria:

- ✓ Adults with MSKD
- ✓ Level 3, 4 or 5 on the Canadian Triage and Acuity Scale

Exclusion criteria:

- ✗ Significant trauma or major MSKD or injury,
- ✗ Red flags,
- ✗ Patients with diagnosed inflammatory arthritis,
- ✗ Active/unstable non-MSKD conditions,
- ✗ Work-related MSKD eligible for workers' compensation benefits.

	26 weeks	11	29.45	26.46	13.82 – 45.09	7	22.00	22.66	5.22 – 38.78	2.30 (-18.15 to 22.75)	
LEFS	Baseline	218	30.54	20.66	27.80 – 33.29	165	29.15	19.83	26.13 – 32.18		
(100-0)	4 weeks	155	59.18	27.38	54.87 – 63.49	100	60.06	27.91	54.59 – 65.53	2.39 (-4.41 to 9.19)	
	12 weeks	136	73.42	27.89	68.73 – 78.11	93	74.17	23.25	69.44 – 78.89	2.62 (-4.41 to 9.65)	0.694
	26 weeks	133	78.31	27.83	73.58 – 83.04	98	76.06	28.78	70.36 – 81.76	-1.27 (-8.25 to 5.72)	
Quick-DASH	Baseline	109	55.96	23.86	51.48 – 60.44	91	58.09	21.60	53.66 – 62.53		
(0-100)	4 weeks	69	30.70	24.15	25.00 – 36.40	59	32.63	22.09	26.99 -38.26	-0.66 (-8.01 to 6.69)	
	12 weeks	61	22.54	23.29	16.70 – 28.38	50	18.05	18.25	12.99 – 23.10	-7.34 (-15.17 to 0.48)	0.228
	26 weeks	63	13.85	19.66	9.00 – 18.71	49	10.85	14.26	6.86 – 14.85	-4.96 (-12.76 to 2.85)	

Negative values for the ODI, NDI and Quick-DASH are in favor of the APP group. Positive values for the LEFS are in favor of the APP group.

Results – Outcomes

		Usual care group				APP care group				Between-group difference	
		n	Mean	SD	95%CI	n	Mean	SD	95%CI	Mean (95%CI)	p value
EQ-5D-5L (1-0)	Baseline	375	0.47	0.25	0.44 – 0.49	286	0.48	0.24	0.45 – 0.50		
	4 weeks	250	0.76	0.20	0.73 – 0.78	181	0.76	0.18	0.74 – 0.79	-0.01 (-0.05 to 0.03)	
	12 weeks	225	0.82	0.17	0.80 – 0.84	168	0.83	0.15	0.81 – 0.85	0 (-0.04 to 0.05)	0.953
	26 weeks	226	0.83	0.18	0.81 – 0.86	171	0.85	0.15	0.83 – 0.87	0 (-0.04 to 0.05)	
EQ-VAS (100-0)	Baseline	369	61.69	23.19	59.33 – 64.06	274	59.90	23.49	57.12 – 62.68		
	4 weeks	245	70.44	21.64	67.73 – 73.15	168	72.33	18.76	69.49 – 75.16	3.35 (-0.99 to 7.69)	
	12 weeks	223	76.77	20.72	74.05 – 79.49	155	76.15	18.81	73.19 – 79.11	1.63 (-2.85 to 6.12)	0.400
	26 weeks	221	80.38	18.83	77.90 -82.87	163	78.49	19.70	75.47 – 81.52	-0.19 (-4.63 to 4.25)	
NPS (0-100)	Before discharge	349	52.38	25.19	49.74 – 55.03	280	56.49	23.37	53.75 – 59.23	4.11 (0.26 to 7.95)	0.036

Positive values for the EQ-5D-5L and EQ-VAS are in favor of the APP group.

Results – Adverse events (6 cases)

- Imaging: 2 cases where physicians wanted imaging
 - No missed Fx
- Medication: APPT recommended NSAIDs, but not advised due to hypertension.
- Discharge: APPT recommended discharge, but patient was seen by orthopaedics and then discharged.
- Discharge: APPT recommended discharge, but patient was admitted to internal medicine.
- Discharge: skin abrasions that needed cleaning before discharge.

Patients presenting with musculoskeletal disorders in the emergency department: A qualitative study of their experiences when cared by advanced practice physiotherapists in the province of Québec

Juliette Blondin^{1,2} | François Desmeules^{1,2} | Eveline Matifat^{1,2} | Amélie Kechichian^{1,3}

Patients' experience - Qualitative analysis (n=11)

Patients had a positive care experience and are highly satisfied with the care received

"The physiotherapist was really good, she really listened to my problem."

"I believe it's one of the times I don't have anything to say about my visit to the emergency room."

Patients perceived PPAs as competent first-contact healthcare providers in the emergency department.

"They give great advices, perhaps even better ones than a physician who sees a bit of everything."

"Even if it's responsibilities that physiotherapist didn't have before, [...] they can manage all that. [...] A great progress for Quebec."

Patients are in favor of the implementation of this new model of care and find it beneficial.

"(...) it can somehow reduce physician's workload and maybe reduce waiting times in the emergency room. "

"(...) medication, I'd prefer to have it prescribed by a physician, or [...] that the physiotherapist suggestion be validated by a physician."

Discussion

The APP model in the ED demonstrates benefits

- Clinical outcomes
 - No differences at 4 weeks
 - Small potentially clinically important differences at 3 and 6 months
- Higher patient satisfaction
- Reduced wait times
- Resource utilization comparable at the initial visit
 - Systematic medical directives sometimes applied for both arms

Discussion

Protocol deviation

ED Physicians modified APP care plan related to personal preferences (60% of cases imaging was added or medication modified)

Follow-up lower than expected (68% at 6 months)

Trial took place during the COVID crisis

Full resource usage and cost-analysis underway

- TDABC direct cost evaluation
- Cost-utility comparison (QALY with EQ5D)

Trial registration

ClinicalTrials.govNCT05545917. Registered on September 19, 2022.
